

FIELD TESTING

Field tests show CovidSafe's efficacy also in heavy use

BEFORE (CovidSafe installed)

AFTER 5 WEEKS

FIELD TESTS IN SUPPORT OF LABORATORY TESTS

Despite the top notch results of laboratory tests, we want to constantly test our product more. Field tests are important to us as they provide the best information on product performance and durability. Results from the field tests will also guide our dealers and installers to better installation and help us further expand our product range.

To test the efficacy and durability of CovidSafe temporary protective coatings, we utilize, e.g. one public transport bus, from which contact surfaces we regularly take bacterial samples. This bus is normally in service on busy routes in the city centre, so the microbial load is significant.

The results of the samples taken from the bus are staggering; the most common disease-causing bacteria are eliminated on the surface of CovidSafe within a few seconds!

The results of the samples taken from the bus are staggering; the most common disease-causing bacteria are eliminated on the surface of CovidSafe within a few seconds!
